

## Chapter 35

1. Describe the initial effect of the following events on the short-run and long-run Phillips curve. That is, describe the movements along a given curve or the direction of the shift in the curve.
  - a. An increase in expected inflation
  - b. An increase in the price of imported oil
  - c. An increase in the money supply
  - d. A decrease in government spending
  - e. A decrease in the minimum wage, which lowers the natural rate
2. Use the Phillips curves in Exhibit 1 to answer the following questions.

Exhibit 1

- a. At what point is the economy located if people expect 10 per cent inflation and inflation actually is 10 per cent?
- b. Referring to (a) above, is unemployment above, below, or equal to the natural rate?
- c. At what point is the economy located if people expect 10 per cent inflation and the actual rate of inflation is 15 per cent?
- d. Suppose the economy is operating at point D. Over time, in which direction will people revise their expectations of inflation: up or down?
- e. Suppose the economy is operating at point D. As people revise their expectations of inflation, in which direction will the short-run Phillips curve shift-right or left?

- f. Suppose the economy is operating at point E. In the short run, a sudden decrease in aggregate demand will move the economy toward which point?
  - g. Suppose the economy is operating at point E. In the long run, a decrease in government spending will tend to move the economy toward which point?
  - h. Suppose people expect 5 per cent inflation. If inflation actually ends up being 10 per cent, in which direction will unemployment move: above or below the natural rate?
3. Use a Phillips curve graph to answer the following questions. Assume the economy is initially in long-run equilibrium.
- a. What happens to an economy's unemployment and inflation rate in the short run if the central bank increases the growth rate of the money supply?
  - b. What happens to an economy's unemployment and inflation rate in the long run if the central bank increases the growth rate of the money supply?
  - c. Can printing money keep unemployment below the natural rate? Explain.
  - d. What is the end result of a central bank repeatedly attempting to hold unemployment below the natural rate with expansionary monetary policy? Explain.
4. Suppose the economy is operating at the natural rate of unemployment with a high rate of inflation (point A in Exhibit 2). Suppose the central bank announces a sudden monetary contraction to reduce inflation. Shown below are two possible paths the economy might take to adjust to the new lower rate of money growth. Choose the path that best depicts what might happen in each of the following cases and explain your reasoning.

Exhibit 2

- a. The central bank's announcement is not believed.
- b. The central bank's announcement is believed and expectations of inflation are adjusted quickly.
- c. The central bank's announcement is believed but all workers have long-term wage contracts that cannot be renegotiated.
- d. Which of the above cases (a, b, or c) best describes what would happen if, in the past, the central bank had repeatedly announced that inflation was its number one priority, but it had failed to actually engage in the threatened monetary contraction? Why?
