

Exercise 2.3

This example has been kept deliberately simple, but there may well be further requirements in your own solutions. It assumes there are only two types of actor, researchers and respondents, and the domain model is very basic. You may well consider other actor roles, requirements, use cases and domain concepts necessary for such an application.

HIGH LEVEL REQUIREMENTS

1. Researchers should be able to register with the system
2. Researchers should be able to create a new questionnaire
3. Researchers should be able to edit an existing questionnaire
4. Researchers should be able to configure a questionnaire's availability
5. Researchers should be able to release a questionnaire
6. Researchers should be able to withdraw a questionnaire
7. Researchers should be able to retrieve the raw data from a completed questionnaire
8. Researchers should be able to perform statistical analysis on questionnaire data
9. Respondents should be able to fill in a questionnaire
10. Respondents should be able to see which questionnaires they have previously answered
